

ABSTRACT OF THE DISCLOSURE

5 A configurable surround sound system for the creation of true
3D acoustic spatial effects. The configurable surround sound
system includes a computer processing unit including a user
interface means including a keyboard and a mouse, and a
conventional controller unit which triggers data messages or a
10 series of data messages to the control processing unit, and further
includes a sound producing member having eight output channels
such as a sound card. Sound signals are transmitted from the sound
producing member to the control producing unit which is directed
either by the controller unit or the user to transmit the sound
15 signals to a mixer board and then to an amplifier which amplifies
the sound signals to a plurality of speakers. Compatible computer
software directs the control processing unit to send sound signals
as desired.
